

Corporate Profile

Our staff of professional consultants and managers have implemented IT solutions for all types of customers, from small commercial clients to enterprise-wide Department of Defense applications serving millions of users.

We are proud of our unmatched record of helping clients achieve success.

LINUX Development and Support

Custom Application Development

Database-driven Solutions

Network Engineering

Program Management

Data Warehousing

Web Development

Microsoft Certified Solutions Provider

COTS Integration

Past Performance:

Worldwide Military Healthcare Interaction Center providing direct support for 8.6 million health plan beneficiaries. This first ever customer relationship management (CRM) solution was implemented using Aballic functional consulting resources and an Oracle solution to ensure prompt response, population of a data mart, and springboard for cost-effective outbound patient education campaigns with the potential cost savings of over \$1 million to the U.S. military.

Custom Conference System developed to perform all functions of a complete conference and event planner and operations center, including conference scheduling, content development, registration, information, and post-conference support. All were previously performed using a Microsoft SQL database and using HTML, ASP, JavaScript, and Visual Basic so users could perform all functions using a common web browser interface. Saved enormous resources for our customer on a firm fixed price basis.

Web-based Print Utility allowed users to print any document on a remote PC and have the document print on a printer located behind a firewall without an Internet IP Address. This unique utility was developed using a custom print spooler solution at a very low cost and high reward to the client in terms of printing support on a firm fixed price basis.

Windows to Linux Transformation of office operations and web services previously using Microsoft to a Linux platform. This project reduced the overall cost of ownership and maintenance of web servers significantly while improving security of those services. This Aballic implementation included a web based email service and a complete eCommerce solution on a time and materials basis within the customer's original budget and on schedule.

Network Security Upgrades project involved installation and configuration of a Linux OS to filter and route Internet traffic based upon the parameters and requirements of our client. The firewall acts as the first line of defense against intrusions into the client's network stopping any incursion and performs extensive logging of all activity.
